In the treatment of pulmonary diseases the inhalation of aerosols plays a key role - it is the preferred route of drug delivery in asthma, chronic obstructive pulmonary disease (COPD) and cystic fibrosis. But, in contrast to oral and intravenous administration drug delivery to the lungs is controlled by additional parameters.

Calcitonin, interferons, parathyroid hormone, and leuprolide are also in human clinical trials for systemic action after inhalation. On the other hand, proteins such as glucagon (used to treat hypoglycemic coma), α 1 -antitrypsin (used for the treatment of emphysema), or growth hormone (used for the treatment of growth deficiency), while attractive molecules for inhalation, have not yet reached the human trial stage.
