When Ethernet was introduced in Automotive industry, control units (ECUs) were usually connected via internal Ethernet controllers to Ethernet switches. With increasing performance requirements and tighter integration of several ECUs, high performance computer (HPCs) were introduced containing several independent virtual machines.

For in-vehicle networking, Ethernet provides all the pre- requisites for such a holistic approach, is suitable as backbone bus to connect the various application domains as well as within domains, when higher bandwidth is required. Today, Fig. 1 Future domain based architecture.

## **Automotive Ethernet: In-vehicle Networking and Smart Mobility**

Here, ECUs are structured in a hierarchical architecture where application domains are connected through a data highway. Ethernet provides all the prerequisites for such a holistic approach. It could be used as a backbone bus to connect the various application domains as well as for sub-networks that just require higher bandwidth.
