In this chapter we will focus on graphical models, in particular causal Bayesian networks. 13.2 Causal Bayesian Networks A Causal Bayesian network (CBN) is a directed acyclic graph, G , in which each node represents a variable and the arcs in the graph represent causal relations; that is, the relation $(A \rightarrow B)$ represents some physical

Furthermore, directed graphical models allow intuitive causal interpretations and have become a cornerstone for causal inference. While there exist a number of excellent books on graphical models, the field has grown so much that individual authors can hardly cover its entire scope.

Chapter 13: Bayesian Inference On Graphical Models - YouTube

As we develop our account of graphical causal models in more detail, we will be able to say more precisely what it means for one variable to be a direct cause of another. While we will not define “cause”, causal models presuppose a broadly difference-making notion of

CAUSAL GRAPHICAL MODELS is causal conditioning, or producing a new ensemble. Sometimes one sees this written as $\Pr X E | X c \hat{=} x c$, or even $\Pr X E | b x c$. I am actually fond of the do notation and will use it. Suppose that $\Pr X E | X c = x c = \Pr X E | \text{do}(X c = x c)$. This would be extremely convenient for causal inference.
