Data Lake Development with Big Data - O'Reilly Media

A data lake is a centralized repository that allows you to store all your structured and unstructured data at any scale. You can store your data as-is, without having to first structure the data, and run different types of analytics—from dashboards and visualizations to big data processing, real-time analytics, and machine learning to guide better decisions.

What is a data lake?

Plug in disparate data sources: Unlike a data warehouse that can only ingest structured data, a Hadoop-powered Data Lake has an inherent ability to ingest multi-structured and massive datasets from disparate sources. This means that the Data Lake can store literally any type of data such as multimedia, binary, XML, logs, sensor data, social ...

Data Lake is not Hadoop. It uses different tools. Hadoop only implements a subset of functionalities. Data Lake is not a database in the traditional sense of the word. A typical implementation of Data Lake uses various NoSQL and In-Memory databases that could co-exist with its relational counterparts. A Data Lake cannot be implemented in isolation.

Defining Data Lake - Data Lake Development with Big Data

Big data/data lakes programs have much to learn from its predecessors. Success can come from capitalizing on the existing successful programs – their processes, timelines, technology, etc. – and identifying such small improvements that can quickly bring business value and garner momentum towards the next milestone.

How to Successfully Implement a Big Data/Data Lake Project ...

When designed well, a data lake is an effective data-driven design pattern for capturing a wide range of data types, both old and new, at large scale. By definition, a data lake is optimized for the quick ingestion of raw, detailed source data plus on-the-fly processing of such data for exploration, analytics, and operations.

Data Lake Development with Big Data by Pradeep Pasupuleti

Transcript: Similar to the way BI and big data differ in their source data, both the granularity and the structure of it, a data lake and a data warehouse share some of those same differences. In the case of a data warehouse, you're using a relational database. Things are very structured. You have tables. You have rows. You have columns.

BI vs. Big Data and Data Warehouses vs. Data Lakes

According to general big data consulting practice, Hadoop Distributed File System (HDFS) is the most popular among the multitude of possible technologies for a big data lake. The reasons are as follows: HDFS is extremely good at handling the diversity of data in a big data lake.
