Abstract Finite element analysis is a widely accepted tool used in many industries and research activities. It allows new designs to be thoroughly 'tested' before a prototype is even manufactured, components and systems which cannot readily be experimented upon to be examined, and 'diagnostic' investigations to be undertaken.

The finite element method (FEM) is a well-established tool that has been widely used to design, develop, and optimize various mechanical structures such as aeroplanes and bridges [e.g., Fagan, 1992]. In brief, FEM works by dividing the geometry of the problem under investigation into a finite number of sub-regions, called elements.

The extended finite element method (XFEM) is a numerical technique based on the generalized finite element method (GFEM) and the partition of unity method (PUM). It extends the classical finite element method by enriching the solution space for solutions to differential equations with discontinuous functions.
