Flash chromatography is basically an air pressure driven hybrid of medium pressure and shorter column chromatography which has been optimized for particularly rapid separation. Flash chromatography is a technique used to separate mixtures of molecules into their individual constituents, frequently used in the drug discovery process.

So, even though flash is an "old" chromatography, it is still the primary purification technique used in the pharmaceutical R&D enterprise because it is fast (Flash!), it is easy to use and it is versatile. The same physical properties that govern HPLC also apply to flash chromatography with the ability to use either normal phase or reverse phase, to use bonded phases to modify elution profiles, etc.

Flash chromatography is a liquid chromatographic separation method used for many years in chemical and organic laboratories, especially for fast preparative purposes. In literature it is described as a "quick-and-dirty" method for the purification or isolation of substances.

Last week my team and I had a seminar on chromatography at the ZHAW Zurich University of

Applied Sciences in Wädenswil. We were excited to lead the part dedicated to flash chromatography in front of 90 lively students who were extremely interested in learning a little bit more on how to do better sample introduction in flash chromatography.

How To Do Sample Introduction in Flash Chromatography ...

Flash Chromatography Flash Chromatography" is a rapid form of preparative column chromatography - Preparative LC based upon "an air pressure driven hybrid of medium and short column chromatography optimized for rapid separation.

Over the past 10 or so years reversed-phase flash chromatography use has increased dramatically. Likewise, reversed-phase preparative HPLC (RP pHPLC) use has also increased. Chemists need to know when to choose between the speed and low solvent use of flash column chromatography and the ultimate purification of RP pHPLC.

In this post I show the results of an orthogonal flash purification approach that first uses normal-phase flash column chromatography to clean up the crude cannabis extract followed by reversed-phase C18 flash chromatography of the isolated target compounds. This orthogonal approach to purification increases the targeted product's purity.

Flash chromatography implies the need to apply some loading-side pressure to the elutant as opposed to older style gravity chromatography. Thus, typical grain size for flash chromatography is smaller and lies in range of 20um to 75um.

How to set up and run a flash chromatography column.

Flash chromatography is a separation technique where smaller sizes of gel particles are used as stationary phase, and pressurized gas is used to drive the solvent through the column. Principle of Flash chromatography
