Fast, Flexible Syntactic Pattern Matching and Processing

In computer science, string-searching algorithms, sometimes called string-matching algorithms, are an important class of string algorithms that try to find a place where one or several strings (also called patterns) are found within a larger string or text.. A basic example of string searching is when the pattern and the searched text are arrays of elements of an alphabet Σ .

To match a character in the string expression against a specific character. Put the specific character directly in the pattern string. Certain special characters must be enclosed in brackets ([]). For more information, see Like Operator. The following example tests whether myString consists exactly of the single character H. Dim sMatch As Boolean = myString Like "H" To match a character in the string expression against a wildcard character. Put a question mark (?) in the pattern string.

A regex pattern matches a target string. The pattern is composed of a sequence of atoms. An atom is a single point within the regex pattern which it tries to match to the target string. The simplest atom is a literal, but grouping parts of the pattern to match an atom will require using () as metacharacters.

During pattern matching, regular characters must exactly match the characters specified in the character string. However, wildcard characters can be matched with arbitrary fragments of the character string. Using wildcard characters makes the LIKE operator more flexible than using the = and != string comparison operators.

In computer science, fuzzy string matching is the technique of finding strings that match a pattern approximately (rather than exactly). In another word, fuzzy string matching is a type of search that will find matches even when users misspell words or enter only partial words for the search.

Up to date, several approaches derived from classical string matching have been proposed to cope with the new search problems, yet each problem had its own algorithms. In this paper we show that a technique recently developed for multipattern approximate string matching is flexible enough to be successfully extended to solve many different music retrieval problems, as well as combinations thereof not addressed before.
