Seismic Design of Composite Steel Deck and Concrete-filled Diaphragms: A Guide for Practicing Engineers Resist out-of-plane forces- Exterior walls and cladding develop out-of-plane lateral inertial forces as a building responds to an earthquake. Out-of-plane forces also develop due to wind pressure acting on exposed wall surfaces.

Preliminary design guidelines are proposed to design the semi-rigid composite frames for the particular base shear. Pushover analysis showed that frames designed for the force calculated using force based design (FBD) approach as given in the code do not give consistent performance in terms of drift levels and drift distribution over height.
