Explore, Choose, Build - Bing Maps API Features and Options

HTML nodes are children of the JavaScript document object, and we obtain a reference to this element via the document.getElementById() method. This code defines a variable (named map) and assigns that variable to a new Map object. The function Map() is known as a constructor and its definition is shown below:

Overview | Maps JavaScript API | Google Developers

Definition and Usage. The createTextNode() method creates a Text Node with the specified text. Tip: Use the createElement() method to create an Element Node with the specified name. Tip: After the Text Node is created, use the element.appendChild() or element.insertBefore() method to append it to an element.
