tendon unit to replace a lost function. This loss of function can be due to a peripheral nerve injury, spinal cord injury, stroke, traumatic brain injury, cerebral palsy, or any other cause. The more closely the tendon to be transferred resembles the nonfunctioning muscle tendon unit, the more likely it will be successful.

A nerve repair is typically immobilized for longer durations (up to 3 weeks) compared

with nerve transfers or grafts. In some cases, surgeons have

advocated only the initial operative dressing following

digital nerve repair. 2

Because nerve transfers and grafts are performed with laxity,

File Type PDF Nerve Repair And Transfers From

the immobilization is less rigid and of shorter duration (typically 7-10 days).

Rehabilitation of the Upper Extremity Following Nerve and

...

Surgical Repair

Surgical nerve repair involves exploration of the injured nerve and removal of injured tissue or scar from the nerve endings. After that, a nerve can be

For example, nerve transfer from the spinal accessory nerve to the suprascapular nerve is now a standard procedure in brachial plexus repair. 62 Small series show better results from this nerve transfer vs grafts from the ruptured C5 root. 63 Combined nerve transfers are also being used: in C5-6 brachial plexus injuries, spinal accessory-to-suprascapular nerve

functioning nerves that are close to the target muscle or sensory area and transfer them to the injured nerve. This provides a close source of nerve for faster recovery. A neurolysis refers to the removal of scar from the nerve and may be used if scar tissue is blocking the nerve from regenerating.

- If options are limited for nerve transfer (e.g., multiple nerves are injured), consider direct/interposed graft repair.
- If faster reinnervation is desired, and some loss of donor nerve function is available and reasonable, consider nerve transfer.

transfer is a procedure that coopts the distal end of a donor nerve to the side of the recipient nerve. Nerve regeneration is facilitated from donor to recipient through a perineurial window to enhance regeneration from the proximal regenerating nerve. This procedure can be used in cases of 2nd/3rd degree nerve injuries [...]

Neuroregeneration

File Type PDF

Nerve Repair And

Transfers From

Hand To Shoulder

An Issue Of Hand

Clinics 10 The

Orthopedics

refers to the regrowth or repair of nervous tissues, cells or cell products. Such mechanisms may include generation of new neurons, glia, axons, myelin, or synapses. Neuroregeneration differs between the peripheral nervous system (PNS) and the central nervous system (CNS) by the functional mechanisms involved, especially in the extent and speed of repair.
