An orthopedic implant is a medical
device manufactured to replace a
missing joint or bone or to support a
damaged bone. The medical implant is
mainly fabricated using stainless steel
and titanium alloys for strength and the
plastic coating that is done on it acts as
an artificial cartilage. Internal fixation is
an operation in orthopedics that involves
the surgical implementation of implants

including spinal cord), arthrogram (for
intra-articular pathology).

Introduction to Orthopaedic Surgery

Over the last years, surgical instrumentation has been developed for this technique in order to allow the procedure to be performed in a safe fashion and with minimal damage to the adjacent intraarticular structures. The procedure is performed with the knee flexed approximately 15-20 degrees.
