A progressive cavity pump is a type of positive displacement pump and is also known as a progressing cavity pump, progg cavity pump, eccentric screw pump or cavity pump. It transfers fluid by means of the progress, through the pump, of a sequence of small, fixed shape, discrete cavities, as its rotor is turned. This leads to the volumetric flow rate being proportional to the rotation rate and to low levels of shearing being applied to the pumped fluid. These pumps have application in fluid meter

### **Progressive cavity pump - Wikipedia**

The Moineau™ pump consists of a single helical steel rotor turning inside a dual helical stator moulded in elastomer. When the rotor turns inside the stator a double chain of watertight cavities is created and fluid is transferred from the pump intake to the pump discharge without shearing the fluid.
