by Prandtl was that when a fluid flows past an object at high Reynolds number, no matter how small the viscous forces might be in the main flow, they must become large in a thin region right next to a solid surface over which the fluid flows.

layers are the same thickness. If the Prandtl number is greater than 1, the thermal boundary layer is thinner than the velocity boundary layer. If the Prandtl number is less than 1, which is the case for air at standard conditions, the thermal boundary layer is thicker than the velocity boundary layer.
