Electric Properties Paper is used for cable wrapping, dielectric media in capacitors and other electric application. The following electric properties are important for paper to be used in electrical applications. Conductance: Electrical conductivity is the ability of a material to carry the flow of an electric current (a flow of electrons). Paper is classified as bad conductor or insulator.

Properties of paper include the thickness, weight, texture, folding endurance, strength and size of the paper. Some grades of paper tear easily, while others resist tearing. The moisture retention capacity is another important property of paper. Some grades of paper dry very quickly and do not absorb moisture.

Subjective Comparison. Paper tubes are great for mid-power rockets, but I feel they aren't durable enough for larger high-power. I don't think the problem is with axial strength, but with resistance to dents and friction. The surface strength can be improved a lot with a fiberglass wrap, which also fills the grooves.

The structural, energetic and electronic properties of chiral (n, m) ($3 \leq n \leq 6$, $n/2 \leq m \leq n$) single-wall copper nanotubes (CuNTs) have been investigated by using projector-augmented wave method based on density-functional theory. The $(4, 3)$ CuNT is energetically stable and should be observed experimentally in both free-standing and tip-suspended conditions, whereas the $(5, 5)$ and $(6, 4)$ CuNTs ...
