A digital refractometer uses the total reflection method to measure the refractive index or related values of a liquid sample. This measurement is done digitally, reducing operator influence considerably. Accuracy of up to 0.00002 or 0.01% Brix can be reached, with small sample volume (0.5 to 1 mL) and short measuring time (a few seconds).

Refractive Index Meter II (PRIM II) | Presidium

The refractive index determines how much the path of light is bent, or refracted, when entering a material. This is described by Snell's law of refraction, $n_1 \sin \theta_1 = n_2 \sin \theta_2$, where θ_1 and θ_2 are the angles of incidence and refraction, respectively, of a ray crossing the interface between two media with refractive indices n_1 and n_2 .
