Pentium, Family of microprocessors developed by Intel Corp. Introduced in 1993 as the successor to Intel's 80486 microprocessor, the Pentium contained two processors on a single chip and about 3.3 million transistors. Using a CISC (complex instruction set computer) architecture, its main features were a 32- bit address bus, a 64-bit data bus, built-in floating-point and memory-management units, and two 8KB caches.

The portable Pentium processor requires a core voltage of 2.9V ±0.165V and switches between 0.25A and 2.65A in about 30ns. This load was simulated by the Power Validator and powered by the circuit of Figure 101.3. Although this circuit works very well over the input voltage range of 5.5V to 28V, it will continue to provide portable Pentium processor core voltage down to a 3.5V input by adding C13 and C14.
