**The Periodic Table**  
The periodic table as we know it today is managed by the International Union of Pure and Applied Chemistry, or IUPAC (eye-you-pack). While much of what is in the periodic table is stable and unlikely to change, the IUPAC organization is responsible for deciding what needs to be changed.

The periodic table, also known as the periodic table of elements, is a tabular display of the chemical elements, which are arranged by atomic number, electron configuration, and recurring chemical properties. The structure of the table shows periodic trends.

**Periodic table - Wikipedia**  
Periodic table, in full periodic table of the elements, in chemistry, the organized array of all the chemical elements in order of increasing atomic number —i.e., the total number of protons in the atomic nucleus. When the chemical elements are thus arranged, there is a recurring pattern called the “periodic law” in their properties, in which elements in the same column (group) have similar properties.

**Periodic Table of Elements**  
The periodic table (also known as the periodic table of elements) is organized so scientists can quickly discern the properties of individual elements such as their mass, electron number, electron configuration and their unique chemical properties. Metals reside on the left side of the table, while non-metals reside on the right.

**The periodic table of the elements by WebElements**  
The periodic table is a chart that arranges the chemical elements in a useful, logical manner. Elements are listed in order of increasing atomic number, lined up so elements that exhibit similar properties are arranged in the same row or column as others. The periodic table is one of the most useful tools of chemistry and the other sciences.

The periodic table is an arrangement of the chemical elements. It is organized based on chemical properties, atomic numbers and the configuration of electrons. Although there were earlier efforts to organize the elements, the periodic table was devised and arranged by a Russian chemist, Dimitri Mendeleev. He came up with the idea in the 1860s.
